Unidad de Reproducción Centro Gutenberg

“Working for your dreams”

www.urecentrogutenberg.es

THE UNIT

The Gutenberg Centre Reproduction Unit (URE) was established in Malaga in 1987. With a team of more than twenty professionals, in 1989 we were able to successfully assist in the very first pregnancy with In Vitro Fertilization in the Malaga province, resulting in a baby girl. This places us as one of Spain's top centres in regards to innovation and expertise.

According to data from the Spanish Fertility Society, The Gutenberg Centre Reproduction Unit is currently the leading specialty fertility clinic for having performed the highest number of assisted reproduction treatments in the province of Malaga.

We bring 30 years of experience to Reproductive Medicine.

FIVE REASONS TO HELP YOU

-  **30 years of experience** make us one of the top fertility clinics in Spain. We know what was done before, we know what is done now and we prepare ourselves every day for what is to come.
-  **We work with people.** We are conscious of the heavy emotional burdens that accompany fertility problems, and we do all that we can to assure that you feel safe and comfortable. Each case is unique and different, meaning that your care will be tailored to your needs. During your treatment you will form part of “our family”.
-  **Our team.** We have a highly qualified team of professionals who know how to work effectively in teams. Physicians, biologists, nurses and assistants all bring admirable professional backgrounds to the table.
-  **Always on the cutting edge.** We are committed to the constant advances that are being made in reproductive medicine, and make it an effort to offer both the latest techniques and the best teams in order to optimize success rates. Our medical and laboratory personnel regularly attend both national and international meetings and conferences that address the latest medical advances.
-  **Good results.** Our good results are the best evidence of our expertise. 95% of our patients would recommend us to others, and our clinic has received excellent overall ratings (information extracted from our patient satisfaction questionnaires integrated in the ISO 9001/2008 Quality Standards).

TREATMENTS

Artificial Insemination

Artificial insemination is the simplest assisted reproduction technique and is used in uncomplicated cases. Many times this technique is a couple's first contact with fertility treatment.

Insemination may be carried out using the partner's or husband's sperm, or donor sperm.

In Vitro Fertilisation

In Vitro Fertilisation is the most common treatment performed in our Reproduction Unit owing to the results obtained as well as the patient profiles we care for. We are highly experienced in this type of treatment and our first baby born from In Vitro Fertilisation was a girl in 1989.

The ICSI technique (intracytoplasmic sperm injection) is normally used for In Vitro Fertilisation.

TREATMENTS

Egg Donation

Egg donation is an assisted reproduction technique with one of the highest success rates and our Unit boasts a specialised team responsible for handling such cases. Egg donation involves In Vitro Fertilisation with the use of eggs from a donor. We carefully select our donors with the help of a rigorous and reliable egg donation programme in which our donors undergo extensive genetic testing. The donated eggs are fertilised and then transferred to the recipient's uterus where they will naturally continue to develop.

Pre-implantation Genetic Diagnosis

The fact that a person suffers from a certain genetic disease or is a carrier of one is not an issue when it comes to having children nowadays. With the Pre-implantation Genetic Diagnosis we are able to perform the embryo transfer to the female's uterus using healthy embryos which are unaffected by the genetic diseases that the parents suffer from or are carriers of.

This is an up-and-coming technique that has experienced exponential growth in recent years.

Preservation of Fertility

Nowadays, freezing eggs and sperm through the process of vitrification is the best and most effective way to preserve your fertility in the case of illnesses such as cancer and for people who voluntarily decide to postpone parenthood.

This treatment allows individuals to indefinitely store their cryopreserved eggs and sperm in gamete banks.
